

Terraform Practical

Name: Pooja Prakash Belgaumkar

1. Creating three EC2 instances using Terraform.

- While creating the instance we can give number of instances to create multiple instances using count = n

```
resource "aws_instance" "id-01" {  
  count = 3  
  ami           = "ami-0c83cb1c664994bbd"  
  instance_type = "t3.micro"  
  subnet_id     = "subnet-0cbc6ee27b50c1eda"  
  vpc_security_group_ids = ["sg-06c3ae8be5e2b7113"]  
  
  tags = {  
    Name = "ec2 machine"  
  }  
}
```

- Run the terraform apply command to create the required infrastructure defined in the .tf files.

```

- We can destroy one specific instance by mentioning the id of the instance

```
01[ip-172-31-8-242:/home/ubuntu/terraform_directory# terraform destroy --target aws_instance.id-01[1]
aws_instance.id-01[1]: Refreshing state... [id=i-0749ee5bfd4c1fc1b]

Terraform used the selected providers to generate the following execution plan. Resource actions
are indicated with the following symbols:
- destroy
```

```
Destroy complete! Resources: 1 destroyed.
