

Terraform Practical

Name: Pooja Prakash Belgaumkar

1. Terraform and AWS credentials security

- In real-world scenarios, storing AWS access keys and secret keys directly in files such as configuration.tf is considered highly insecure.
- If these credentials are exposed, it could lead to serious security breaches and potential financial or operational risks for the organization.
- To mitigate this risk, instead of hardcoding credentials in Terraform files, it is recommended to install the AWS CLI and configure credentials securely using the aws configure command.
- This approach stores credentials in a protected location (~/.aws/credentials) and ensures that sensitive information is not exposed in the Terraform configuration files, enhancing overall security.

```
provider "aws" {  
  region      = "eu-north-1"  
  access_key  = "AKIA3ORXSTS[REDACTED]"  
  secret_key  = "UoM2mptMTaSsrGu9tL+qpb[REDACTED]"  
}
```

```
root@ip-172-31-8-242:/home/ubuntu/terraform_directory# aws --version  
aws-cli/2.33.19 Python/3.13.11 Linux/6.14.0-1018-aws exe/x86_64.ubuntu.24  
root@ip-172-31-8-242:/home/ubuntu/terraform_directory#
```

```
root@ip-172-31-8-242:/home/ubuntu/terraform_directory# aws configure  
AWS Access Key ID [None]: AKIA3ORXS[REDACTED]  
AWS Secret Access Key [None]: UoM2mptMTaSsrGu9tL[REDACTED]  
Default region name [None]:  
Default output format [None]:  
root@ip-172-31-8-242:/home/ubuntu/terraform_directory#
```
